

CellIDs for Katie

Here, on the bottom are the clusters from the multiome object (res 0.4), and on the right are the clusters from the previous object (clusters49). POA clusters (according to that paper) are clusters that align to clusters 8, 10, 19, 25, 45, and 48

From this; I'd say we are *decently* confident that multiome clusters 1, 8, 19, 21, 23, 27, and 28 are POA clusters. I'm also going to include cluster 0 in my "likely" POA clusters because it expresses several POA markers.

Here is the old object with it's native labels

And with the labels from the multiome object

Thus, my current opinion on cell types is as follows

Cluster	ID
0	POA_1
1	POA_2
2	Radial Glia
3	gal+ (This may be POA)
4	Oligo
5	Npy+ Cckbra+
6	Dm
7	Tac1+_1
8	POA_3
9	Tac1+_2
10	Ccka+_1
11	Ccka+_2
12	Ach+ Kiss+
13	Ccka+ Cckb+
14	Microglia
15	Ignore
16	GLUT_1
17	Tac1+ Cckb+
18	Oligodendrocyte Precursor
19	POA_4
20	Sst+ interneuron
21	POA_5
22	Ependymal
23	POA_6
24	GLUT_2
25	GABA_1
26	Leukocytes
27	POA_7
28	POA_8
29	Fibroblasts (possibly endothelial)
30	Ignore (olfactory bulb)
31	GABA_2

That being said, I have changed my classifications on what is and isnt POA several times, so this is by no means a final list.
